

What is claimed is:

1. An RFID card issuing system comprising: data input means;
data storing means; photographing means; ID number reading
means; a database; system software; image processing software;
5 and card printing means provided with a card in which an
electronic tag is previously stuck to a rear surface and
executing a printing to a main surface of said card, said
system performing:

(a) a step of inputting personal information of a person
10 whose personal information is registered in said database by
said data input means, and registering said personal
information in said database by said system software;

(b) a step of acquiring an image data by taking a
photograph of said person by said photographing means,
15 thereafter acquiring said image data in a folder which stores
said image data and is provided in said data storing means by
driving said image processing software by means of said system
software, applying a predetermined file name to said image data,
registering said file name in said database, and associating
20 said file name with said personal information;

(c) a step of reading said personal information of said
person and said file name of said image data from said database
by said system software to send them to said printing means,
printing said personal information and said image data on said
25 main surface of said card by said printing means, and issuing
an RFID card; and

(d) a step of reading an ID number of said electronic tag
from said electronic tag on said rear surface of said card by

said ID number reading means, registering said ID number in said database by said system software, and associating said ID number with said file name and said personal information.

5 2. The RFID card issuing system according to claim 1,
 wherein said step (d) is executed during the execution of said step (c).

3. The RFID card issuing system according to claim 1,
10 wherein said ID number reading means is provided in said printing means.

4. The RFID card issuing system according to claim 1,
 wherein a communication distance of said ID number
15 reading means is 3 cm or shorter.

5. The RFID card issuing system according to claim 4,
 wherein said ID number reading means is a wire antenna.

20 6. The RFID card issuing system according to claim 5,
 wherein a receiving portion of said ID number reading means includes a first region extending in parallel to an extending direction of said electronic tag during said step (c), and a second region extending in a direction intersecting said
25 extending direction of said electronic tag.

7. The RFID card issuing system according to claim 1,
 wherein said electronic tag includes a read-only storage

element.
